JAVA PROJECT REPORT ON

Electronic Store Product Catalog and Sales Management System

Submitted by

Netra.S

25BIT130

Under the Guidance of

Mugilan.R

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026

Semester: **II**

DECLARATION

I hereby declare that the project entitled “Electronic Store Product Catalog and Sales Management System” submitted in partial fulfillment of the requirements for the course java programming is a record of my original work carried out under the guidance of [Mugilan.R], Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

Netra.S

CERTIFICATE

This is to certify that the project entitled “Electronic Store Product Catalog and Sales Management System” is a bona fide work carried out by Netra.S, [BSC.IT “B” (2025-2028)], B.Sc.INFORMATION TECHNOLOGY, KG College of Arts & Science, in partial fulfillment of the requirements for the course JAVA PROGRAMMING

This project has been completed under my supervision and guidance during the academic period **April 2026**.

Place: Coimbatore

Date:

Submitted for the Viva-Voce Examination held on _____

Guide:
(Technical Trainer, KGCAS)

_____

Head of the Department
(Technical Head, KGCAS)

ABSTRACT

The Electronic Store Product Catalog and Sales Management System is a Java-based application developed to automate the process of placing sales and generating sales records in online shopping environments. In many small businesses, product catalog and sales management are still handled manually, which can lead to calculation errors, delays in processing sales, and difficulty in maintaining accurate records. This project aims to simplify and streamline the sales management process by providing an automated system that processes product sales and generates an accurate sales record.

The system allows users to select products from a predefined product list, enter the quantity of each item, and automatically calculate the total cost of the sale. It then generates a structured sales record displaying details such as product name, quantity, price, subtotal, applicable taxes, and the final payable amount. The application is developed using Core Java programming concepts, including classes, objects, methods, loops, conditional statements, and exception handling. The project can be implemented as a console-based application or enhanced using Java Swing to provide a graphical user interface.

The main objective of the system is to improve the efficiency of sales management, reduce manual errors, and provide faster and more reliable service to customers. The system generates a clear and organized sales record that helps both customers and businesses maintain accurate transaction records.

This project demonstrates the practical implementation of object-oriented programming concepts in Java and provides a foundation for developing more advanced e-commerce and online sales management systems in the future.

1. INTRODUCTION

In today's digital world, online shopping and electronic transactions have become an important part of modern business operations. Many businesses sell products through online platforms where customers can place sales and receive sales records automatically. However, in some small businesses, product catalog and sales management are still performed manually using paper records or simple calculators. This manual approach can lead to calculation errors, delays in sales management, and difficulties in maintaining transaction records.

With the advancement of computer technology, automated sales management systems have become essential for improving efficiency and accuracy in business operations. A computerized sales management system allows businesses to manage product sales, calculate the total amount automatically, and generate sales records quickly and accurately.

The Electronic Store Product Catalog and Sales Management System is a Java-based application designed to automate the process of sales management and sales record generation for online purchases. The system allows users to select products from a predefined product list, enter the quantity of items, and automatically calculate the total cost including applicable taxes. The application then generates a structured sales record displaying product details, quantities, prices, subtotal, tax, and final payable amount.

This project is developed using **Core Java programming concepts** such as classes, objects, methods, loops, conditional statements, and exception handling. The application can be implemented either as a console-based program or using Java Swing to create a graphical user interface (GUI).

The main goal of this system is to simplify sales management, reduce manual errors, and provide faster sales record generation for businesses and customers. This project also demonstrates how Java programming can be used to develop practical applications for real-world business environments.

1.1 Objective

The main objective of the Electronic Store Product Catalog and Sales Management System is to develop a simple and efficient Java-based application that automates the process of managing online sales and generating sales records.

The specific objectives of this project are:

• To design and develop a Java-based sales management system.
• To automate the calculation of product prices and total sale amount.
• To reduce manual errors in product catalog and sales management.
• To provide a user-friendly system for generating sales records quickly.
• To demonstrate the implementation of Core Java programming concepts such as classes, objects, loops, and conditional statements.
• To generate a clear and organized sales record for customers.

1.2 Overview

The Electronic Store Product Catalog and Sales Management System is a menu-driven application developed using the Java programming language. The system provides a digital platform where users can select products from a predefined list and generate sales records automatically.

The system displays a list of available products along with their prices. The user can select the required items and enter the quantity for each product. The program then calculates the total price for each item and generates a final sales record including applicable taxes such as GST.

The system simplifies the sales management process by eliminating manual calculations and reducing the chances of billing errors. The application can be implemented as a console-based program or as a graphical user interface using Java Swing.

This project demonstrates the practical use of Java programming in developing real-world applications for small businesses and online retail systems.

1.3 Features

The Electronic Store Product Catalog and Sales Management System includes the following main features:

• Product Display – Displays a list of available products along with their prices.
• Order Selection – Allows the user to select products and enter the quantity.
• Automatic Price Calculation – Automatically calculates the total cost based on selected items and quantities.
• Tax Calculation – Calculates applicable taxes such as GST and adds them to the total amount.
• Sales Record Generation – Generates a detailed sales record showing product names, quantities, prices, subtotal, tax, and final amount.
• User-Friendly Interface – Provides a simple and easy-to-use menu-driven interface.
• Fast Order Processing – Reduces the time required to generate sales records.

2. PROGRAM ANALYSIS

Program analysis is an important stage in software development where the problem is studied and system requirements are identified. This phase helps in understanding how the system should function and what features are required to solve the problem effectively.

The analysis phase focuses on identifying the problems in the existing system and designing a computerized solution that improves efficiency and accuracy.

2.1 Problem Definition

In many small businesses, product sales and billing are still managed manually using paper records or calculators. This traditional approach can create several problems.

Some common issues include:

• Errors in sale calculation
• Time-consuming billing process
• Difficulty in managing multiple sales

• Lack of proper transaction records
• Slow customer service during busy hours

Manual systems also increase the workload for staff and may lead to customer dissatisfaction due to delays or incorrect sales records.

Therefore, an automated system is required to process sales efficiently and generate accurate sales records.

The Electronic Store Product Catalog and Sales Management System is designed to solve these problems by providing a computerized solution that automates product catalog and sales management.

2.2 Project Overview

The Electronic Store Product Catalog and Sales Management System is a Java-based application designed to simplify the product catalog and sales management process.

The system provides a menu-driven interface where users can select products from a predefined list and specify the quantity of each item saleed. The system automatically calculates the total price of the selected items and generates a final sales record.

The system includes the following functionalities:

• Displaying the product list with prices
• Selecting products and entering quantity
• Automatically calculating item cost
• Computing subtotal and tax amount
• Generating the final sales record for the customer

This project is implemented using Core Java programming concepts and can be developed as either a console-based application or a GUI-based application using Java Swing**.**

2.3 Scopes and Limitations

Scope

The scope of the Electronic Store Product Catalog and Sales Management System includes:

• Managing product information
• Processing product sales
• Automatically calculating the total sale amount

• Generating a detailed sales record for customers
• Demonstrating the practical use of Java programming concepts

The system can be used in:

• Online stores
• Retail shops
• Small businesses
• E-commerce applications
• Billing systems for product sales

3.SYSTEM DESIGN

System design is the phase where the structure and components of the system are planned before implementation. This stage helps organize the program and define how different modules will work together.

The Electronic Store Product Catalog and Sales Management System is designed as a menu-driven application where users can select products, enter quantities, and generate sales records automatically

3.1 Modules

1. Product Display Module

This module displays the list of available products along with their prices.

Example Menu:

1. Laptop – ₹50000
2. Mobile Phone – ₹20000
3. Headphones – ₹2000
4. Keyboard – ₹1500
5. Mouse – ₹500

The product list helps the user select items easily.

---

2. Order Selection Module

This module allows the user to select products and enter the quantity.

Functions include:

• Accepting product selection
• Accepting quantity input
• Storing sale details temporarily

Users can select multiple products before generating the final sales record.

---

3. Bill Calculation Module

This module performs all billing calculations.

The system calculates:

• Total price of each product
• Subtotal of all items
• Applicable tax (GST)
• Final payable amount

Example Calculation:

Item Total = Price × Quantity
GST = 5% of Subtotal
Final Bill = Subtotal + GST

---

4. Sales Record Generation Module

This module generates the final sales record.

The sales record includes:

• Product name
• Quantity
• Price
• Subtotal
• GST amount
• Final amount

Example Output:

------ INVOICE ------

Item	Qty	Price
Laptop	1	50000
Mouse	2	1000

Subtotal	51000
GST (5%)	2550
Total	53550

Thank You for Your Purchase!

5. Exit Module

This module allows the user to safely exit the application after completing the sale process.

This module allows the user to exit the application safely after completing the billing process.

When the user selects the exit option, the system terminates the program.

4.METHODOLOGY

Methodology describes the process followed during the development of the project.

The development process includes:

- Problem Analysis
- System Design
- Program Development
- Testing and Validation
- Result and Documentation

4.1. Problem Analysis

In this phase, the problems in manual sales management systems are studied.

Common problems include:

- Manual calculation errors
- Slow billing process
- Difficulty handling multiple sales
- Lack of proper sale records

Based on these issues, an automated system is designed.

4.2. System Design

The system is divided into modules:

• Product Display Module
• Order Selection Module
• Bill Calculation Module
• Sales Record Generation Module
• Exit Module

4.3. Program Development

The system is developed using Java programming language.

The development process includes:

• Creating classes and methods
• Implementing menu-driven logic
• Writing billing calculation code
• Accepting user input
• Displaying the final sales record

4.4. Testing and Validation

Testing ensures the program works correctly.

Example Test Cases:

Test Case	Expected Result
Select product	Product displayed correctly

Test Case	Expected Result
Enter quantity	Quantity accepted correctly
Calculate bill	Correct total displayed
Invalid input	Error handled properly

4.5. Result and Documentation

After successful testing, the system generates sales records based on selected products and quantities.

Screenshots of program input and output are included for documentation.

4.6. Algorithm

Algorithm for the Electronic Store Product Catalog and Sales Management System:

1. Start the program.
2. Display the product list with prices.
3. Ask the user to select a product.
4. Enter the quantity of the product.
5. Calculate the total cost of the item.
6. Add the cost to the subtotal.
7. Repeat steps 3–6 for additional products.
8. Calculate GST or tax amount.
9. Calculate the final sales record amount.
10. Display the sales record.
11. End the program.

4.7. Flowchart

Example flow:

Start

↓

Display Product Menu

↓

Select Product

↓

Enter Quantity

↓

Calculate Bill

↓

Generate Sales Record

↓

End

Students can draw the flowchart using:

- draw.io
- Lucidchart
- MS Visio

```
import java.util.Scanner;

public class OnlineOrderSystem {

    public static void main(String[] args) {
```

```
        Scanner sc = new Scanner(System.in);

        int choice, quantity;
        double price = 0, total = 0, grandTotal = 0;
        char more;

        System.out.println("===== ONLINE ORDER PROCESSING AND INVOICE
GENERATION SYSTEM =====");

        do {
            System.out.println("\n---------- PRODUCT MENU ----------");
            System.out.println("1. Laptop        - Rs 50000");
            System.out.println("2. Mobile Phone  - Rs 20000");
            System.out.println("3. Headphones    - Rs 2000");
            System.out.println("4. Keyboard      - Rs 1500");
            System.out.println("5. Mouse         - Rs 500");

            System.out.print("Enter product number: ");
            choice = sc.nextInt();

            System.out.print("Enter quantity: ");
            quantity = sc.nextInt();

            switch (choice) {
```

```
    case 1:
        price = 50000;
        break;
    case 2:
        price = 20000;
        break;
    case 3:
        price = 2000;
        break;
    case 4:
        price = 1500;
        break;
    case 5:
        price = 500;
        break;
    default:
        System.out.println("Invalid choice!");
        price = 0;
}

total = price * quantity;
grandTotal += total;

System.out.println("Item Total = Rs " + total);
```

```
            System.out.print("Do you want to sale more items? (y/n): ");
            more = sc.next().charAt(0);

        } while (more == 'y' || more == 'Y');

        System.out.println("\n========== INVOICE ==========");
        System.out.println("Total Amount to Pay: Rs " + grandTotal);
        System.out.println("Thank you for your sale!");

        sc.close();
    }
}
```

7.DISCUSSION & CONCLUSION

7.1 Discussion

The Electronic Store Product Catalog and Sales Management System was developed to automate the product catalog and sales management process. The system allows users to select products, enter quantities, and generate sales records automatically.

The project applies Core Java programming concepts such as loops, conditional statements, methods, and object-oriented programming principles.

The system was tested with different inputs and successfully produced accurate sales records.

7.2 Conclusion:

The Electronic Store Product Catalog and Sales Management System demonstrates the practical use of Java programming in developing real-world applications.

The system simplifies sales management, reduces calculation errors, and generates accurate sales records quickly. It helps businesses improve efficiency and maintain proper transaction records.

This project provides a strong foundation for developing more advanced **e-commerce and billing systems** in the future.
